SOLUTION PITCH

BharatVoiceAI

Every shopkeeper deserves the independence to run their business.

THE PROBLEM

Retail software still assumes every shopkeeper can read a screen, type quickly, and navigate complex menus. For blind, low-vision, and motor-impaired merchants, even routine billing or stock checks can demand outside help. English-first interfaces create another barrier in a country where business happens in many languages.

OUR SOLUTION

BharatVoiceAI makes store management conversational. Shopkeepers can ask about sales, check stock, record expenses, and manage billing by speaking in Telugu, Hindi, Tamil, Kannada, Malayalam, or Indian English. Gnani.ai's Prisma speech recognition and Timbre voice responses help turn spoken requests into actions and read information back aloud.

BUILT FOR REAL SHOPS

The platform brings itemized billing, inventory tracking, low-stock alerts, sales insights, and expense records into one retail workspace. Financial commands require explicit confirmation before changes are saved. Double-entry accounting and audit records help protect the accuracy and traceability of every transaction.

WHY IT MATTERS

Imagine a shop owner asking, "What were today's sales?" and hearing the answer in their own language. That simple exchange represents something bigger: fewer barriers at the counter, greater control over daily decisions, and the freedom to run a business with confidence and dignity.

Technology should adapt to the shopkeeper, not the other way around.
